Table des matières:

I. generate unique key for the payout transaction
II. initiate the payout
III. get the response of initiate payment
IV. the third one is to ask the status of the transaction

Process of Withdrawaf in NOKASH

Find the link of the postman collection file here: postman collection

I. generate unique key for the payout transaction

This is done via the api:

http method	POST
url	**https://api.nokash.app/lapas-on-trans/trans/auth**
parameters	- **i_space_key**: the key of the integrator - **app_space_key**: the key of your app
response	● **status**: the status of your request. possible values are: ○ LOGIN_SUCCESS: your keys have been verified. ○ LOGIN_BAD_INFOS: keys haven't been verified ○ … others are unknown errors; you may report it to us please. ● **message**: the message of the server ● **data**: the data of the response; when the status is LOGIN_SUCCESS, data is the generated key for the withdrawal. *Notes on this key:* - *is usable one time only* - *expired after 2 minutes*

II. initiate the payout

This is done via the api:

http method	POST
url	**https://api.nokash.app/lapas-on-trans/trans/api-payin-request/407**
header	**auth-code**: the generate key from the previous api
parameters	
body	• **i_space_key**: the key of the integrator • **app_space_key**: the key of the app. • **payment_type**: the type of payment needed ○ for **CM** country, use: **CM_MOBILEMONEY** ○ for **NG** country, use: **NG_BANKTRANSFER** • **country**: the iso alpha 2 of the country (only **{CM, NG}** are available now) • **payment_method**: the payment method to use for the payment; ○ for **CM** country, use these: **MTN_MOMO, ORANGE_MONEY** ○ for **NG** country, use these: **BANK_TRANSFER**; • **order_id**: the unique id of the transaction in your system • **amount**: the amount of the transaction ○ minimum for CM country is: 1 XAF ○ minimum for NG country is: 100 NGN • **callback_url** (optional and only for production keys): this is an endpoint you will open in your system to let us send you the status of the request when it is changed. It is a post request with this body data: id, status, amount, phone, orderId; • **user_data**: the information of the user which depend on the payment type: ○ for payment_type: **CM_MOBILEMONEY**, set field: ■ **user_phone**: the user phone number ○ for **NG_BANKTRANSFER** payment_type, set fields: ■ **user_email**: the user email address ■ **user_name**: the user name ■ **user_bank_code**: the user bank code ■ **user_bank_account**: the user bank account

III. get the response of initiate payment

The structure of the response is:

- status: the status of your request.
  possible values are:
  - REQUEST_OK: process have been initiate
  - REQUEST_BAD_INFOS: you did not send an information
  - … others are unknown errors; you may report it to us please.
- message: the message of the server
- data: the data of the response;
  - when status is not REQUEST_OK, data is null
  - when it is REQUEST_OK, data is an object.

data object structure depend on **payment_type** used when initiating the payment:

- for payment_type **CM_MOBILEMONEY** :
  - **id**: the unique id of the payment in our system (you will use it to get the status of the payment)
  - **status**: current status of the payment; possible values are: PENDING, FAILED, CANCELED, TIMEOUT, SUCCESS
  - **amount**: the amount of the payment.
  - **orderId**: the id from your system
  - **phone**: the phone number of payer
- for payment_type **NG_BANKTRANSFER:**
  - **id**: the unique id of the payment in our system (you will use it to get the status of the payment)
  - **status**: current status of the payment; possible values are: PENDING, FAILED, CANCELED, TIMEOUT, SUCCESS
  - **amount**: the amount of the payment.
  - **orderId**: the id from your system
  - **va_bank_code**: the bank code of VA generated
  - **va_bank_name**: the bank name
  - **va_account_number**: the VA generated
  - **va_expiry_date_in_utc**: expiration data of the va in utc
  - **user_name**: the payer name
  - **user_email**: the payer email

IV. the third one is to ask the status of the transaction

Use the second api in the documentation of API Payin.
